Experiments on CISCO Packet (Simulation Tool)

Aim: To understand the environment & behaviour of network devices of CISCO packet tracer simulator

1) Peer-to-Peer Connection (P2P):-

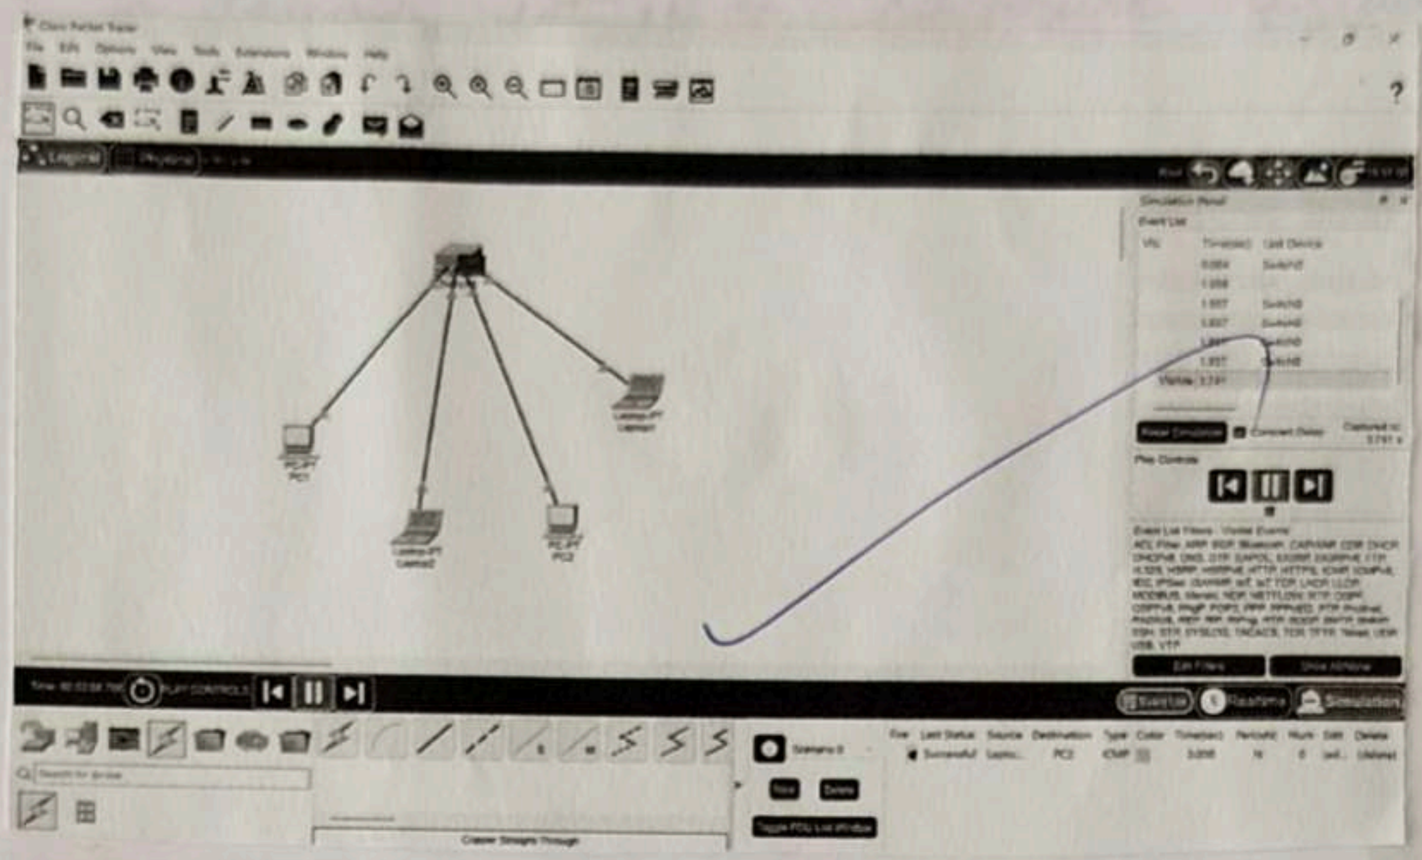

Cross-Over cables were used to connect the PC & the laptop.

Only a cross-over cable can enable communication directly between same type of End-Devices.

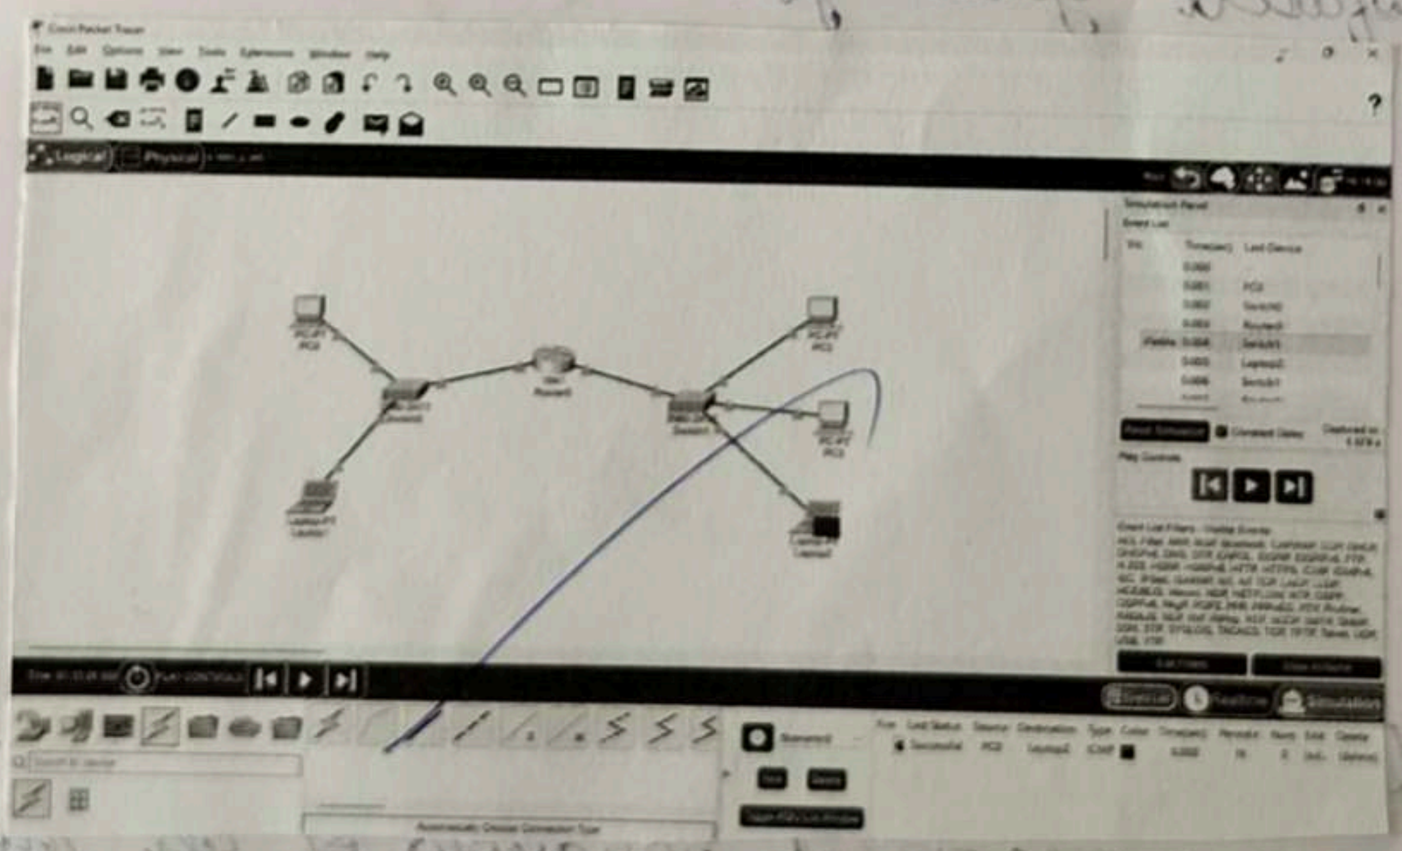

Usage of such cables have been replaced by switches, hubs & routers.

(2) Hub Connection :-

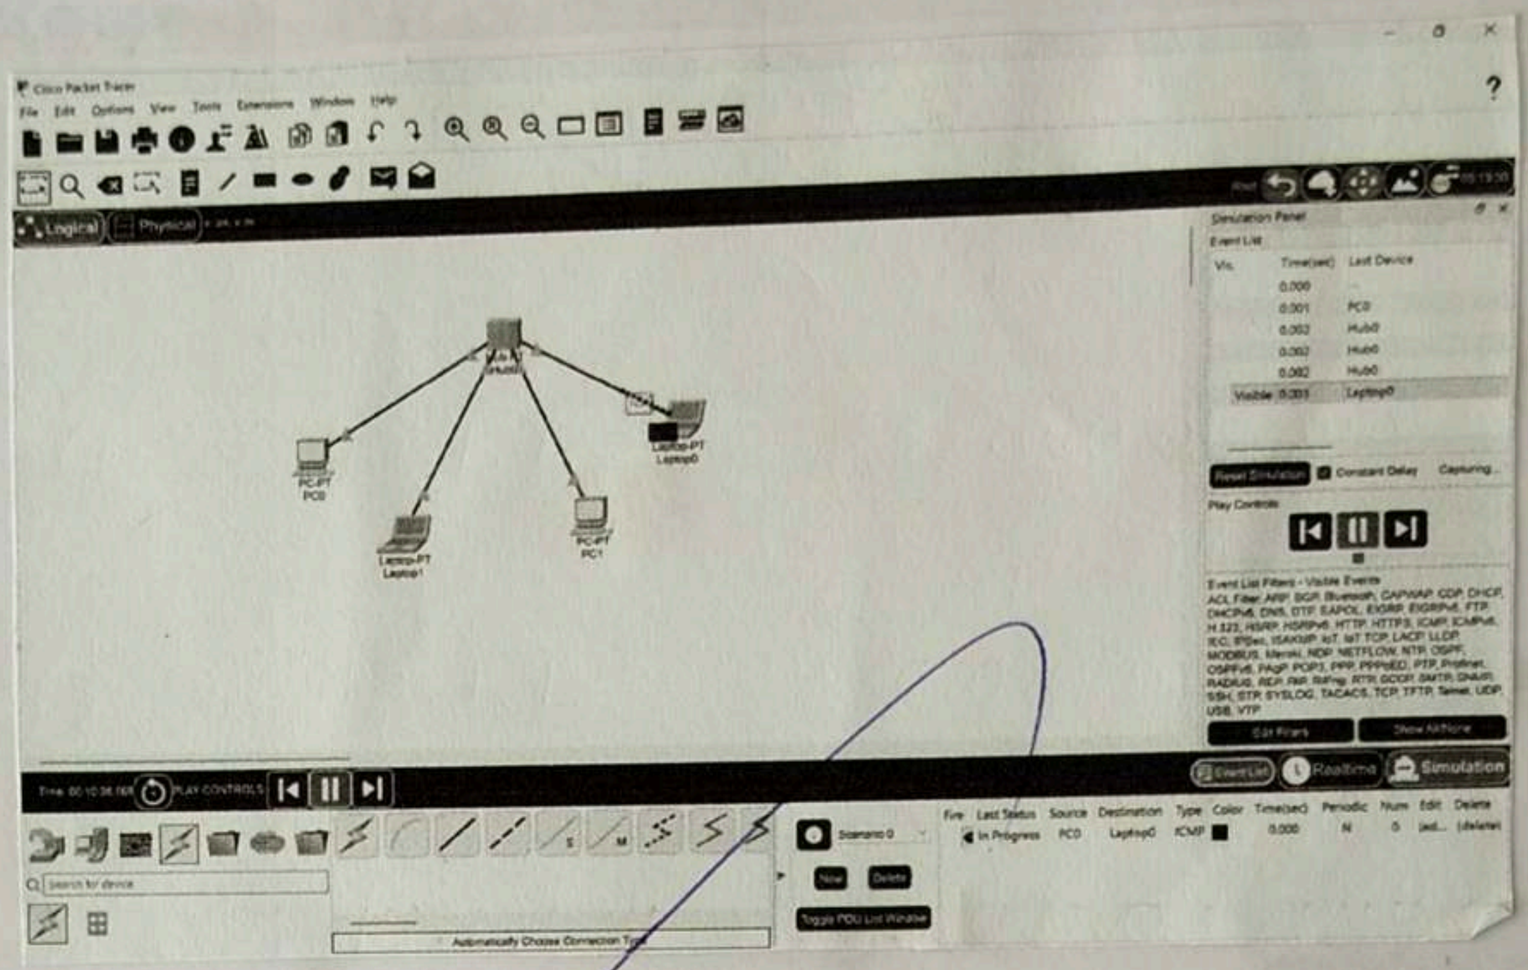

A hub connects multiple devices in a network by blindly broadcasting all incoming data signals to every connected devices.

(3) Switch Connection :-

Switch connects multiple devices within single LAN & intelligently forwards data packets directly to specific destination using MAC addresses.

④ Router Connection :-

A router connects multiple devices in a network & routes data packets between them.

A router connects different subnets or distinct networks together, directing data traffic between them using IP addresses & default gateways.

Result : Hence the environment of CISCO PACKET TRACER & behaviour of all the network devices in the software were studied, simulated & verified successfully.
